

## Project Tracker

### **Overview:**

The project that I am building is a project tracker. This project tracker is utilized to ensure the manager can maintain a schedule, budget, and task list. This application can be manipulated to handle any sort of project the end user is wanting to accomplish. This product can track anything from construction to software.

### **Personas:**

With this application, I intend to focus on three users. The overall project manager, the stakeholder, and the assistant to the project manager. The flow of communication is vital through these individuals when planning and executing the project. The application will alleviate the use for meeting with the stakeholder to just provide an update of how the project is progressing. The stakeholder will be able to login into the application and view the pertinent information they are seeking. This will improve efficiency and waste time when moving through the project timeline.

### **Problems, Solutions, Interactions:**

This application primary solution is for people that are managing multiple projects to ensure they are tracking all aspects of each project. I intend to create a user-friendly application to maintain the given information from the customer and ensure they are returned with the adequate information necessary to complete their project.
